Every name, company and number in this file is made up. The company, Example Supply Co., does not exist, and the email addresses use example.com, a domain reserved for documentation.

A good test file is predictable. You know how many pages, rows, images or seconds it has, so you can check that your code reports the same numbers. The page this file came from lists those facts and a SHA-256 checksum for each file.

Use small files for quick checks and larger ones to see how your code behaves when a file takes longer to read. Try the unusual variants too: they are the ones that tend to break upload forms and parsers.

The quarterly figures in the tables are fictional sample data. They follow simple rules so that totals add up: each line total is quantity multiplied by unit price, and the grand total is the sum of the line totals.
